

GENETICS

AGAIN PARANORMAL INHERITANCE?

4.08.2006

Following the exciting Lolle paper, now again non-chromosomal transfer of genetic information in a new study of Mary Alleman. Yes, of course, humans inherit mito DNA, there is imprinting, but also siRNA (not found in maize) or RNA polymerases (found!)? BTW much fuss of maternal imprinting in genetic epidemiology is simply preferential maternal reporting.

Addendum

[Pollen contamination](#) may have been the reason for the Lolle/Pruitt results.
