**GENETICS** 

## A ZEBRA TAKES ITS STRIPES WHEREVER IT GOES

12.10.2006

This week ends with another African proverb and some thoughts on transcription factor binding sites.

Commenting on the work of <u>Janssens</u> that "there is no inherent reason that CRMs [cis regulatory modules] must lie on a contiguous segment of DNA or that they must contain clusters of sites", <u>Halfon</u> still expresses the hope that "we should be able to identify the regulatory elements for any gene starting with only the DNA sequence".

Although an <u>old dream</u>, I am now rather sceptical if this prediction will ever work. Recognize the differences of my drawing compared to original figure: I am introducing even another level of temporal relationships. There might be even a close relationship to yesterdays post on "<u>retaliation</u>", yea, yea.
