

GENETICS

# SNAPSHOT OF YOUR WORKING DIRECTORY

7.11.2006

We need two open source programs: [Gzip](#) is a compression utility with a high compression rate and free from patented algorithms. [GnuPG](#) is a complete and free encryption solution to protect confidential communication and digitally stored information. Create a /backup directory in each of your working directories.

[backup.cmd](#)

|wj\_backup.cmd|

Write the above code in a file, put it somewhere in your path and assign an icon (I am running this from the buttonbar of TotalCommander (R)). One click – and your current directory is being saved as zip file and signed with your key.
