NEW LD MEASURE

6.12.2006

There is a new way to calculate LD that may overcome the limitations of D' and R^2 that are not easily generalizable to multiallelic markers (or haplotypes) and depend on the distribution of SNPs (or haplotypes).

The paper is at [BMC](#), the sources at the [authors' website](#). I have slightly modified the program to allow input and output file names on the command line before [compiling](#) it. Use at your own risk, yea, yea.
