RETRACTION

18.12.2006 1 COMMENT

Working in a field where hundreds of papers are published every year and none is ever retracted, I highly appreciate a letter in [Science](#).

...D1 dopamine receptor (D1R)-stimulated intracellular Ca^{2+} release was attributed to a direct interaction with calcyon ... the ability of calcyon and D1Rs to co-immunoprecipitate when co-expressed in cells as reported presumably stems from the association of both proteins with clathrin-coated vesicles...thus, the isolation of the calcyon clone in a Y2H screen with D1Rs appears to have been adventitious...

In my opinion this comment advance science and give the authors a much higher credibility than any further paper. Yea, yea.

Hi Matthias,

Your nice blog about this retraction led me to contact the Schizophrenia Research Forum

<http://www.schizophreniaforum.org/new/detail.asp?id=1312>

A story about this retraction has recently been posted.

Thanks for this !!

Cheers

John
