MANY, MANY MAPS

10.03.2007 1 COMMENT

Ever since I created a linkage map of the human genome with old-fashinoned <u>crimap</u>, we are talking about "mapping" diseases and genes. GIS mapping also ever increases – see the interesting first monday article <u>Many, many maps</u>: Empowerment and online participatory mapping, that has a lot of details about grassroots initiatives building on Keyhole/Google technology. I learned also about <u>Common Census</u> – looks like grassroot epidemiology.
