MANY, MANY MAPS

10.03.2007 1 COMMENT

Ever since I created a linkage map of the human genome with old-fashinoned [crimap](#), we are talking about "mapping" diseases and genes. GIS mapping also ever increases – see the interesting first monday article *[Many, many maps](#): Empowerment and online participatory mapping*, that has a lot of details about grassroots initiatives building on Keyhole/Google technology. I learned also about [Common Census](#) – looks like grassroot epidemiology.
