CASTRATED DATA

19.09.2007

Nature had some [good recommendations](#) —

... there are challenges to making data on individual research participants available to other investigators, every effort should be made to provide researchers with an opportunity to reproduce the reported results and to investigate new hypotheses and methods.

accompanied by a bullet list

* Statement on availability of results and data so that, as far as possible, others can analyse them independently

The new [expression paper](#) published 3 days ago, however, ignores that largely by including only a 700 MB! results browser (!) instead of the original genotyping data.
