

ALLERGY

# AUTO DESENSITIZATION

20.10.2007

[Blackley](#) found already in 1873 an interesting explanation of the “no allergy in farming children” effect by referring to some kind of auto desensitization in this particular environment – e.g. the high pollen and LPS exposure.

Do you know that a commercial allergen preparation used for desensitization already includes a LPS derivate, 3-o-desacyl-4' monophosphoryl lipid A as an adjuvant? It is believed to push the pollen reaction into a IL12 - IFNg - Th1 pathway. This therapeutic approach already perfectly fits the early explanation of Blackley.

When will the allergy farming lobby ultimately close their files?
