# OUTLOOK CALENDAR EXPORT

27.12.2007

It should be quite easy to export Outlook appointments into .ics format and let third party applications like [phpicalendar](#) stitch these snippets together into a coherent view. Unfortunately older Outlook versions are not supporting ics export. After several frustrating attempts (installing VB macros that are buggy and software like [freemical](#) that misses important fields) I finally wrote my own exporter that includes also a category filter as otherwise too many entries will have to be parsed by phpicalendar.

[ol2ics.zip](#) includes the source perl script including a compiled windows version.  
|wj\_olics.txt|

The ics file may then be uploaded to the phpicalendar directory using a [wput](#) call like  
`wput -reupload my.ics ftp://name:password@domain.de/calendar/my.ics`
