ALLERGY

CF AND PHP AT THE SAME TIME

6.06.2008

For a clinical research project I need a fast webserver that understands both COLD FUSION (for the existing database stuff) and PHP (for dokuwiki). As this is a non-commercial project, I decided for the RAILO 2.0 community version that works right out of the box as it includes the Resin webserver and the H2 database as well. Following some recommendations found on the net, php is running now with with the fastcgi option showing ~~good~~ acceptable performance with eAccelerator.
