

ALLERGY, GENETICS

GHOST IN YOUR GENES

24.06.2009

was an earlier title of a BBC documentation about gene methylation. While running today an analysis of segregating methylation marks, I have major difficulties to find out the status of the human epigenome map. The [Sanger site](#) seems to be down for a long time, there aren't any updates of the AHEAD consortium, the site of the [Epigenetics Society](#) is largely uninformative, methDB gives me "information about the research situation in France and why French scientists are in conflict with the current government", an EU network excellence has only a [fashionable website](#) while [another EU project is even not fashionable](#). Or do I miss [something](#)??
