ALLERGY, GENETICS

GHOST IN YOUR GENES

24.06.2009

was an earlier title of a BBC documentation about gene methylation. While running today an analysis of segregating methylation marks, I have major difficulties to find out the status of the human epigenome map. The <u>Sanger site</u> seems to be down for a long time, there aren't any updates of the AHEAD consortium, the site of the <u>Epigenetics Society</u> is largely uniformative, methDB gives me "information about the research situation in France and why French scientists are in conflict with the current government", an EU network excellence has only a <u>fashionable website</u> while <u>another EU project is even not fashionable</u>. Or do I miss <u>something?</u>?
