INTERNET NEUTRALITY

28.07.2009

A new Science paper is worried about internet neutrality:

> … Researchers who support “network neutrality” have become worried that the Internet may lose its innovative edge. They are concerned that control could be shifting from the edges of the Internet toward the service providers at the center, which would allow the providers to have “gatekeeper” capacity and would contradict the Internet’s “end-to-end” principle . This core tenet states that control over information flows should take place, to the extent possible, at the end points of the network…

While politicians are still debating on that issue, darknets alre already running in HTML 5 browsers like Veiled…
