

GENETICS

EVOLUTIONARY LEGACY

5.01.2010

It's an exceptional good science book – Cancer, The evolutionary legacy – by [Mel Greaves](#). Having written last year a grant application about resequencing of lung specimens (and more recently a correspondence letter about the lung [cancer genome](#) that updates our earlier [31 events](#) to [22,910](#)) I am quite interested in the “minimal cancer genome”, e.g. the driving forces that leads to the final uncontrolled expansion of cancer cells.

[Mutations are part of our life](#) – or in other words (by Gui Patin, Paris, 1665, cit. on page 233)

Cancer cannot be cured and will never be cured; but the world wants to be fooled
