# MAKING THE INVISIBLE MOTION VISIBLE

28.06.2012

Here is a new MIT video software, that constructs first a backbone of an object showing minor movements while then amplifying these movements to a ridiculous extent. Not clear what I try to explain? See a video at [SPON](#). Although the idea behind is quite simple and even the implementation not too difficult I see a great potential for monitoring babies ( and even small animals ) as it is running in real-time. More videos at [web.mit.edu](http://web.mit.edu), yea, yea.
