AVOID SPINNERS

17.04.2014

I see spinners everywhere – although I once learned that this is just poor website design. There are even [spinner factories](#) to create you own custom waiting room.

As I am doing a lot of time consuming jpg manipulation here and didn't want to further increase any server overhead, I went back to rather old fashioned method – the turning slash known from old UNIX and DOS times. It expands my previous article on [avoid-browser-flickering-with-dark-backgrounds](#) writing to the preloader div and stopping after loading the iframe.

```
var str = "|/-\\";  
var i = 1;  
function myLoop () {  
  setTimeout(function () {  
    j=str.charAt(i%(str.length));  
    $('#preload').text( i ) ;  
    i++;  
    if (i<99) myLoop();  
  }, 150)  
}  
myLoop();  
$(function(){  
  $('#iframe').load(function(){  
    i=99;  
  });  
});
```
