ADDING LOCAL JSON DATA WITHOUT AJAX REQUEST

8.10.2015

I need to include a json file from a local directory while ajax requests did not work in some browsers (due to cross domain security issues). The final solution turned out to be quite simple, just adding a variable definition before the xml code:

```
var json =  
[  
  {  
    "id": "0",  
    ...  
  }  
];  
var json = JSON.parse(json);
```

and including it as as the first script being loaded

```
<script src="js/json.js"></script>
```

The json var can then be processed in all other scripts.
