UPDATING TO PHP 7.0

29.01.2016

“Deprecated means deprecated” this is what I learned today. In practice, PHP finally kicked out some functions breaking now my web serve. Errors may be expected

* when a variable is used but not declared before.

* split is deprecated, use explode instead and take care that there is always something to explode

```
list($a,$b) = explode("/", "$word/");
```

* eregi is deprecated, use

```
preg_match('/hello/', $string);
```

* end(\$array) is not working, use

```
$array[count($array) - 1]
```

The true/false shortcuts `1 > 1 ? T : F` isn't anymore acceptable

```
1 > 1 ? true : false
```

Unfortunately owncloud calendar sync stopped working – took me quite some time to find out why

```
Array to string conversion at  
/owncloud/3rdparty/sabre/dav/lib/CalDAV/CalendarQueryValidator.php#62
```

As owncloud [hotfixes](#) did not work and a own cloud update failed, I had to switch back to 5.6.
