# FORWARD WORDPRESS URL VARIABLE TO IFRAME URL VARIABLE

10.07.2019

It may not be the best programming idea, but iframes are still quick way to add an existing page into a WordPress hierarchy.

There are many ways to forward an URL variable to an iframe (php function, plugin, ...) while I think the easiest way is a short javascript

```
url_string = new URL(window.location.href);
uuid = url_string.searchParams.get("uuid");
new_url_string = 'https://xxx/index.php?uuid='+uuid;
el = document.getElementById('iframe');
if (uuid) { el.src = new_url_string };
```

and hook that into wordpress at the end of functions.php

```
add_action( 'wp_enqueue_scripts', 'myscript' );
function myscript() {
    wp_enqueue_script( 'myscript', 'https://xxx/myscript.js"',
    array(), false, true );
}
```

the last wp\_enqueue\_script parameter is important...
