# PYTHON3 CV2 INSTALLATION

20.01.2020

Homebrew is struggling with the [older python 2.7 version](#) that is missing ssl support. Python 3.8 did not recognize cv2 but this finally worked

```
brew install python3
brew postinstall python3
pip3 install virtualenv virtualenvwrapper
virtualenv env_name --python="python3"
/Users/wjst/env_name/bin/pip3 install opencv-python
/Users/wjst/env_name/bin/pip3 install pandas scipy matplotlib Pillow
tqdm sklearn imageio
/Users/wjst/env_name/bin/python3 -c "import cv2"
```

then I could finally run the [image forgery detection](#) from Github.

```
cd /Users/wjst/Desktop/image-copy-move-detection-master
/Users/wjst/env_name/bin/python3
> from copy_move_detection import detect
> ...
```
