HOW TO STREAM FROM YOUR PHONE

14.02.2023

Wireless transmission worked perfect for me with Elgato's EpocCam transmission from iPhone to Macbook where I am using OBS . And well, the native USB connection works now out of the box since macOS 13 Ventura.

But how to attach the mobile cam under Linux? So far I connected only DSLRs but found only recently DroidCam that includes not only Android and iPhone but also a Linux client. As a bonus multiple remote actions are possible from setting white balance to focus mode or using flash settings.
