Stack Overflow announced that they are partnering with OpenAI, so I tried to delete my highest-rated answers.

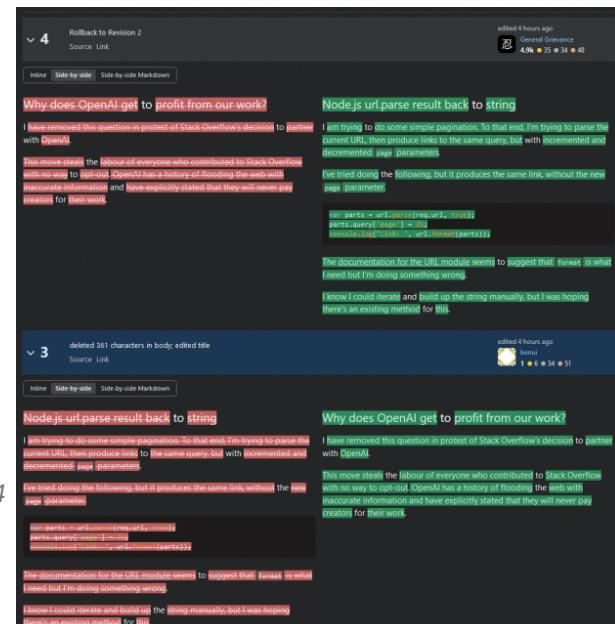

Stack Overflow does not let you delete questions that have accepted answers and many upvotes because it would remove knowledge from the community.

So instead I changed my highest-rated answers to a protest message.

Within an hour mods had changed the questions back and suspended my account for 7 days.

Post 4: Why does OpenAI get to profit from our work?
I have removed this question in protest of Stack Overflow's decision to partner with OpenAI.
This move steals the labour of everyone who contributed to Stack Overflow with no way to opt-out. OpenAI has a history of flooding the web with inaccurate information and have explicitly stated that they will never pay creators for their work.
I am trying to do some simple pagination. To that end, I'm trying to parse the current URL, then produce and to be same query, but with incremented and decremented page parameters.
I've tried doing the following, but it produces the same link, without the new page parameter.
`var parts = url.parse(req.url, true);
parts.query.page = 2;
const url = url.parse(url, true, parts);`
The documentation for the URL module seems to suggest that `parse` is what I need but I'm doing something wrong.
I know I could iterate and build up the string manually, but I was hoping there's an existing method for this.

Post 3: Node.js url.parse result back to string
I am trying to do some simple pagination. To that end, I'm trying to parse the current URL, then produce and to be same query, but with incremented and decremented page parameters.
I've tried doing the following, but it produces the same link, without the new page parameter.
`var parts = url.parse(req.url, true);
parts.query.page = 2;
const url = url.parse(url, true, parts);`
The documentation for the URL module seems to suggest that `parse` is what I need but I'm doing something wrong.
I know I could iterate and build up the string manually, but I was hoping there's an existing method for this.
