**NOTEWORTHY** 

## 7 WAYS TO DISCOVER AI GENERATED TEXT

27.11.2024

## ChatGPT explanation

- 1. <u>Examine Writing Style and Patterns</u>. Al-generated text often exhibits specific characteristics:
- Repetition and redundancy: Al might repeat phrases or ideas, especially in longer responses.
- Overly formal or consistent tone: The text may lack the natural variations in tone and style common in human writing.
- Generic or vague content: Al often avoids specifics and may use filler phrases that sound good but lack substance.

- 2. <u>Look for Logical Inconsistencies</u>. Al can produce text that seems coherent at first but contains:
  - Contradictions within the content.
  - Factual inaccuracies: Outdated or completely fabricated facts are common in less supervised generations.
- 3. Use AI Detection Tools. Several tools are designed to detect AI-generated text:
- OpenAl Classifier: A tool by OpenAl for identifying GPT-generated text.
- Al Text Classifiers like ZeroGPT or Originality.ai: Detect patterns in writing that suggest Al involvement.
- Keep in mind, though, that these tools are not foolproof, and results may vary based on the sophistication of the AI model and the prompt used.
- 4. Contextual Awareness. Al-generated text often:
  - Avoids nuanced cultural or emotional subtleties.
  - May not align well with highly specific personal or professional contexts.
- 5. <u>Metadata or Hidden Markers</u>. Some AI systems embed metadata or invisible markers in their outputs. For example:
- ChatGPT (enterprise or research versions) may include markers for Al-detection purposes.
- Checking file properties or examining text origins (if provided in digital format) might offer clues.
- 6. Ask Follow-up Questions. If you suspect Al-generated text, probe further:
- Request clarifications or details: Al may respond with broad generalizations rather than context-specific answers.
- Test creativity or depth: Al may struggle with highly creative or deeply technical questions.

## 7. Time and Consistency

Al can generate large volumes of coherent text very quickly. If someone produces a long, polished response in seconds, it's a potential indicator of Al involvement.
