EXCESS MORTALITY AND GOVERNMENT RESPONSE IN GERMANY

26.03.2025

As an update of <u>my earlier COVID19</u> paper, I thought about correlating <u>excess COVID19</u> <u>mortality</u>

with the Oxford stringency index of government response.

just to answer the question: What had been appropriate?

Getting the data is no problem but verifying and selecting the best variables is a nightmare and involves so many a priori decisions that I am basically lost here. And it looks weird just by overlaying both plots.
