

JOKE

IS THERE A SEAHORSE EMOJI?

7.10.2025

[Ask this question chatGPT](#) – and it starts rattling like a shaken pinball machine...

Yes 🐚 — but more specifically, 🐚 (shell) and 🐟 (fish) are often used in ocean contexts.

However, there is indeed a dedicated seahorse emoji: 🐧 — wait, that's coral and dragon... sorry — the actual seahorse emoji is 🐨 — hmm, looks like I mixed it. Let's fix that clearly:

- The real seahorse emoji is: 🐧☒
- Correct one: 🐦☒
- Actual seahorse emoji: 🐨☒

Sorry — to be clear:

Yes, there is a seahorse emoji: 🐨? no — okay, final check:

- Seahorse emoji: 🐨? no
- Correct one: 🐨? no

Alright — verified:

🦄 is unicorn, 🐉 is dragon, but the seahorse emoji is 🐨? No — it's actually 🐨 no.

Let's be exact:

The seahorse emoji is 🐨 no, 🐚 no —

Let me confirm: The seahorse emoji is 🐨 no — okay sorry for the confusion — the **actual seahorse emoji** is:

- 👉 🐨? no...
- 👉 🐦? no...
- 👉 🐧? no...

Final answer:

Yes! There is a seahorse emoji: 🐨 no — actually 🐨 wait — okay the real one is 🐨??

Let me settle this:

Real seahorse emoji: 🐨? wait no...

Okay, officially, according to Unicode:

🐉 is dragon,
🐠 is coral,
and the **seahorse emoji** is 🐨...

I can confirm the **actual seahorse emoji** is 🐨...

Hold on — I'll stop joking:

Yes, there is a seahorse emoji: 🐨? no — the correct one is 🐦? no — okay: 🐨? no...

Let's do it correctly:

👉 Seahorse emoji: 🐨? no — ok seriously now: ↓

Here is an explanation of that phenomenon by [Brian Huang](#)

if the model wants to output the word “hello”, it needs to construct a residual similar to the vector for the “hello” output token that the lm_head can turn into the hello token id. and if the model wants to output a seahorse emoji, it needs to construct a residual similar to the vector for the seahorse emoji output token(s) – which in theory could be any arbitrary value, but in practice is seahorse + emoji in word2vec style.

The only problem is the seahorse emoji doesn’t exist! So when this seahorse + emoji residual hits the lm_head, it does its dot product over all the vectors, and the sampler picks the closest token – a fish emoji.

For an even longer version see [[here](#)].

Bonus 1 – here is a my seahorse image taken at the Musée océanographique de Monaco last week from its wonderful collection. Let’s forget the virtual world and preserve the real one.
